Professional Summary

Full-stack software developer building production-grade applications in Next.js, TypeScript, Go, and Python, with PostgreSQL and Supabase backends deployed via CI/CD on Vercel. Comfortable designing REST APIs, authentication, and role-based access control for multi-user systems, and integrates Claude and OpenAI APIs into working product features as part of an AI-assisted development workflow. Currently apprenticing at Zone01 Kisumu, a peer-to-peer, project-based software development program.

Technical Skills

Languages: TypeScript, JavaScript, Go, Python, SQL, Bash

Frameworks: Next.js, React, FastAPI, Gin, Tailwind CSS, GORM

Tools: Git, GitHub Actions, Vercel, Docker, Linux, REST APIs, Webhooks, CI/CD, OAuth 2.0

Experience

Full-stack Developer (apprentice) | Zone01 Kisumu *January 2026 – Present*

- Built and deployed full-stack applications in Next.js, TypeScript, Go, and Python to production on Vercel, using CI/CD pipelines for automated deployment.
- Implemented REST APIs with JWT authentication and role-based access control (RBAC), enabling secure multi-user access across applications.
- Integrated Claude and OpenAI APIs into product features, including a Q&A tool using FAISS vector search and RAG pipelines, working daily with Claude Code and Cursor as part of an AI-assisted development workflow.
- Collaborate in a peer-to-peer team, reviewing each other's code and working through problems together. Also participated in a hackathon as part of a 5-person team, contributing to a shared codebase under time pressure.

IT Attachment | County Government of Uasin Gishu *May 2023 – August 2023*

- Completed a 4-month industrial attachment with the IT department, focused primarily on network and hardware troubleshooting for government office systems.
- Diagnosed connectivity and equipment issues across multiple departments, working alongside full-time IT staff and gaining practical exposure to structured IT support processes.

Selected projects

HarvestHost | Next.js, TypeScript, Supabase, IntaSend | 2026

- Built a full-stack agritourism platform using Next.js, TypeScript, PostgreSQL/Supabase, and IntaSend to solve the problem of Kenyan farm owners having no digital channel to reach tourists, bookings were manual and payments cash-only.
- Designed and shipped the entire system including JWT-based multi-route auth middleware and role-based access, Supabase Storage with RLS policies, and a complete mobile payment flow via IntaSend STK push.
- Serves 3 user roles (farmer, visitor, admin) across 9 database tables, with payouts automatically split 90% to farmers and 10% platform fee.

Production API | Go | 2026

- Built a Go HTTP middleware library using net/http to handle cross-cutting concerns that kept getting rewritten across projects: request logging, rate limiting, CORS, timeout handling, and panic recovery.
- The library ships 7 middleware components. Setup that previously required writing middleware from scratch now takes under 30 minutes on 2 projects so far. Each component is independently imported and configurable with no framework dependency.

Education

BSc information technology | Dedan Kimathi University of Science and Technology *Graduated December 2024*

Certifications

AWS Cloud 101 (Jan 2025) | AI & ML Fundamentals, Africa Agility (Jan 2025) | IBM Granite & Cloud Computing, IBM SkillsBuild (Feb 2025)
